A Prismatic Analysis of the Israeli-Palestinian Conflict (1967-Present): Applying Jazinski's Prismatic Method

Executive Summary

This report applies Jazinski's Prismatic Method to analyze the Israeli-Palestinian conflict from 1967 to the present, demonstrating how the same empirical signals—security incidents, settlement expansion, legal rulings, and peace process outcomes—generate fundamentally different interpretations when processed through divergent analytical grammars. The analysis reveals that three distinct grammars (Security-Sovereignty, Legal-Humanitarian, and Structural-Colonial) transform identical data into incompatible narratives. Between 1967 and 2013, Israeli settlements expanded from 1 to 125 in the West Bank, with settler population growing from 4,400 (1977) to 325,456 (2011). The Second Intifada (2000-2006) resulted in 3,808 Palestinian and 1,010 Israeli deaths. The ICJ ruled the separation wall illegal in 2004, yet construction continued. This prismatic analysis demonstrates that resolution failure stems not from information deficits but from incommensurable interpretive frameworks that process identical signals into mutually exclusive closure states.

---

1. Observation Field Declaration

Temporal Boundaries: June 1967 (Six-Day War) to March 2026 (present analysis date)

Geographic Scope: West Bank, Gaza Strip, East Jerusalem (territories occupied since 1967)

Phenomenon Under Observation: The Israeli-Palestinian conflict as manifested through security dynamics, territorial control, legal frameworks, and diplomatic processes

Data Sources: Academic literature on conflict dynamics, settlement patterns, international legal rulings, peace process documentation, and empirical security statistics [13], [14], [30]

Observation Constraints:

- Analysis limited to post-1967 occupation period
- Primary focus on West Bank due to data availability

- Gaza disengagement (2005) creates analytical discontinuity
- Access restrictions limit direct field observation data

Declared Observer Position: This analysis adopts a meta-analytical stance, examining how different interpretive frameworks process identical empirical signals rather than advocating for any single framework's validity.

---

2. Signal Set

2.1 Core Signals (Empirical Data Points)

S1: Settlement Expansion Trajectory

- 1967: 1 settlement in West Bank
- 1977: 31 settlements, 4,400 settlers
- 1986: 110 settlements, 55,100 settlers
- 2001: 123 settlements, 211,416 settlers
- 2011: 325,456 settlers in West Bank
- 2012: 125 settlements total
- East Jerusalem: 118,100 (1989) → 184,707 (2007) residents
- 41.9% of West Bank under direct settlement control [30]

S2: Security Incidents and Casualties

- First Intifada (1987-1993): 1,042 Palestinians killed, 118 Israelis killed
- Second Intifada (2000-2006): 3,808 Palestinians killed, 1,010 Israelis killed
- Operation Cast Lead (2008-2009): 1,378 Palestinians killed (733 non-combatants), 13 Israelis killed
- 2008 (10 months): 290 settler-related incidents, 131 Palestinian casualties
- 67 Palestinian mothers forced to give birth at checkpoints (2000-2005); 36 babies died [14], [30]

S3: Territorial Control Infrastructure

- Separation Wall: 700 km length, 85% within West Bank territory
- 1994-1999: 230 checkpoints installed, 499 days of closures
- September 2013: 99 fixed checkpoints in West Bank
- End of 2012: 532 terrestrial obstacles
- 120 km roads completely prohibited for Palestinians
- 245 km roads partially prohibited
- 365 km roads with restricted use [30]

S4: Governance Fragmentation (Oslo Framework)

- Area A: 17.2% of territory (2000), Palestinian civil and security control
- Area B: 23.8% of territory (2000), Palestinian civil control, Israeli security control
- Area C: 59% of territory (2000), full Israeli control
- Palestinian Authority controls 18% of historic Palestine [10], [30]

S5: International Legal Rulings

- UN Security Council Resolution 242 (November 1967): Declared occupation illegal, required Israeli withdrawal [4]
- UNSC Resolution 446 (March 22, 1979): Settlements have no legal validity [13]

- ICJ Advisory Opinion (July 9, 2004): Separation Wall contrary to international law, demanded dismantling [13], [14], [25]
- UNGA Resolution ES-10/15 (July 20, 2004): Demanded Israeli compliance with ICJ ruling [25]
- ICJ OPT Advisory Opinion (2024): States obligated not to recognize Israeli presence as legal [22]

S6: Peace Process Milestones

- Oslo Accords (September 1993): Declaration of Principles, mutual recognition [10], [20], [30]
- Interim Agreement (1995): Created Areas A/B/C division [13]
- Camp David II (July 2000): Negotiations collapsed [10], [20]
- Quartet Road Map (April 30, 2003): Called for settlement freeze, aimed for Palestinian state by 2005 [13], [19], [20]
- Annapolis Conference (2007): Renewed negotiations [30]

S7: Settlement Expansion During Peace Process

- 1993-2000 (Oslo period): Settler population increased almost 100% in West Bank (excluding East Jerusalem) [23]
- Political process did not impede settlement activities [23]

S8: Economic Indicators

- EU investment: €218.5 million (2016) for democracy/rule of law
- EU allocation: €10 million (2016) for economic development
- EU contribution: €82 million (2016) to UNRWA for refugees
- Palestinian unemployment radically increased due to Israeli policies [19], [30]

S9: Judicial Accountability Metrics

- 2005-2013: 8.5% of 938 investigations into settler violence resulted in indictment
- Less than 3% of those judged received conviction [30]

S10: Demographic Data

- 6.6 million Palestinian refugees worldwide
- 427,000 internally displaced Palestinians (67% of total Palestinian population) as of end 2008 [13]

2.2 Counter-Signals (Anomalies and Contradictions)

CS1: Gaza Disengagement (August 15, 2005)

- Israel evacuated 21 settlements from Gaza Strip and 4 from Samaria
- Contradicts linear settlement expansion narrative
- Demonstrates capacity for territorial withdrawal [19]

CS2: Legal Compliance Paradox

- International legal rulings consistently declare Israeli actions illegal
- Yet construction and settlement expansion continue unabated
- ICJ 2004 ruling on wall followed by continued construction [13], [25]

CS3: Peace Process-Settlement Correlation

- Settlement expansion accelerated during peace negotiations (1993-2000)
- Suggests peace process may enable rather than constrain territorial changes [23]

CS4: Asymmetric Casualty Ratios

- Second Intifada: 3.8:1 Palestinian-to-Israeli death ratio
- Operation Cast Lead: 106:1 ratio
- Challenges symmetrical "conflict" framing [30]

CS5: Judicial System Ineffectiveness

- 8.5% indictment rate for settler violence investigations
- Suggests formal legal structures exist but lack enforcement capacity [30]

---

3. Grammar Specifications

Grammar 1: Security-Sovereignty Grammar

Ontological Commitments:

- Primary units: Nation-states as sovereign actors
- Conflict nature: Security dilemma between competing national movements
- Causality: Actions driven by security imperatives and existential threats

Epistemic Rules:

- Privilege state security narratives and threat assessments
- Interpret territorial control as security necessity
- Frame violence as defensive response to aggression
- Validate state sovereignty claims over international law when they conflict

Transformation Protocols:

- Settlement expansion → Security buffer zones
- Military operations → Counter-terrorism measures
- Checkpoints/barriers → Security infrastructure
- Casualties → Unfortunate but necessary costs of self-defense

Closure Criteria:

- Successful when security is achieved through territorial control
- Validated by reduction in attacks on Israeli civilians
- Legitimized by democratic mandate within Israeli polity

Boundary Conditions:

- Excludes pre-1967 territorial claims
- Minimizes occupation framework
- Treats Palestinian governance as security threat rather than legitimate authority

Grammar 2: Legal-Humanitarian Grammar

Ontological Commitments:

- Primary units: Individual rights-bearers under international law

- Conflict nature: Belligerent occupation subject to humanitarian law
- Causality: Actions evaluated against legal obligations and human rights standards

Epistemic Rules:

- Privilege international legal frameworks (Geneva Conventions, ICJ rulings, UN resolutions)
- Interpret territorial changes through legality/illegality binary
- Frame violence through proportionality and distinction principles
- Validate international institutions over unilateral state actions

Transformation Protocols:

- Settlement expansion → Illegal population transfer (Fourth Geneva Convention Article 49(6))
- Military operations → Potential war crimes requiring investigation
- Checkpoints/barriers → Violations of freedom of movement
- Casualties → Humanitarian crisis requiring accountability

Closure Criteria:

- Successful when international law is upheld
- Validated by compliance with ICJ rulings and UN resolutions
- Legitimized by protection of civilian populations

Boundary Conditions:

- Excludes security justifications that violate legal norms
- Minimizes political feasibility considerations
- Treats state sovereignty as subordinate to international law

Grammar 3: Structural-Colonial Grammar

Ontological Commitments:

- Primary units: Colonizer-colonized relationship structures
- Conflict nature: Settler-colonial project of territorial displacement
- Causality: Actions driven by structural imperatives of demographic transformation and land acquisition

Epistemic Rules:

- Privilege historical patterns of colonial settlement
- Interpret territorial control as demographic engineering
- Frame violence as inherent to colonial dispossession
- Validate indigenous resistance against settler expansion

Transformation Protocols:

- Settlement expansion → Colonial land appropriation
- Military operations → Enforcement of colonial order
- Checkpoints/barriers → Apartheid-like spatial segregation
- Casualties → Structural violence of colonial system

Closure Criteria:

- Successful when colonial structures are dismantled

- Validated by restoration of indigenous sovereignty
- Legitimized by decolonization precedents

Boundary Conditions:

- Excludes symmetrical conflict framing
- Minimizes security dilemma interpretation
- Treats legal frameworks as insufficient without structural transformation

---

4. Signal Processing

4.1 Security-Sovereignty Grammar Processing (800-1500 words)

When the Security-Sovereignty Grammar processes the signal set, it constructs a narrative of existential threat management and legitimate state security imperatives. The settlement expansion trajectory (S1) transforms from a demographic fact into a strategic security architecture. The growth from 1 settlement in 1967 to 125 settlements by 2012, with 325,456 settlers by 2011, represents not territorial aggrandizement but the establishment of security buffers and strategic depth [30]. The concentration of 57% of settlers within 10 kilometers of Jerusalem becomes a defensive perimeter protecting Israel's capital [13].

This grammar processes the First and Second Intifadas (S2) as validation of security concerns. The 1,042 Palestinian deaths during the First Intifada appear as regrettable but necessary responses to violent uprising, while the 118 Israeli deaths demonstrate the genuine threat faced by Israeli civilians. The Second Intifada's escalation—3,808 Palestinian and 1,010 Israeli deaths—confirms the security imperative [30]. Operation Cast Lead's 1,378 Palestinian casualties (including 733 non-combatants) are reframed through proportionality doctrine: 13 Israeli deaths represent the threat that necessitated the operation, while Palestinian casualties reflect Hamas's use of human shields and civilian infrastructure for military purposes [30].

The territorial control infrastructure (S3) undergoes complete semantic transformation. The 700-kilometer separation wall, 85% of which lies within West Bank territory, becomes a "security fence" that demonstrably reduced suicide bombings. The 99 fixed checkpoints and 532 terrestrial obstacles are not instruments of population control but necessary security screening mechanisms [30]. The 290 settler-related incidents in 2008 that caused 131 Palestinian casualties are processed as isolated criminal acts, not systemic violence, while the low conviction rate (less than 3% of cases) reflects evidentiary challenges rather than structural impunity [30].

The governance fragmentation (S4) created by Oslo—with Area C comprising 59% of territory under full Israeli control—is interpreted as a temporary security arrangement pending final status negotiations, not permanent territorial annexation [30]. The Palestinian Authority's control over only 18% of historic Palestine represents the maximum autonomy compatible with Israeli security requirements [10].

International legal rulings (S5) are processed through a sovereignty filter. UN Security Council Resolution 242's call for Israeli withdrawal is read as requiring negotiated borders, not unilateral retreat to 1967 lines. The ICJ's 2004 advisory opinion declaring the wall illegal is dismissed as non-binding and insufficiently attentive to security realities [13], [25]. The grammar emphasizes that the ICJ lacks enforcement mechanisms and that democratic states retain the right to self-defense even when international institutions disagree.

The peace process milestones (S6) are interpreted as Israeli good-faith efforts repeatedly undermined by Palestinian violence. Oslo (1993) represented unprecedented Israeli concessions—recognition of

Palestinian national aspirations and territorial withdrawal—met with terrorism rather than reciprocal peacemaking [10], [20]. Camp David II's collapse in 2000 is attributed to Yasser Arafat's rejection of generous Israeli offers, followed immediately by the Second Intifada's launch, proving Palestinian unwillingness to accept Israel's existence [10], [20].

Counter-signal CS1 (Gaza disengagement in 2005) becomes powerful evidence within this grammar. Israel's evacuation of 21 Gaza settlements and 8,000 settlers demonstrates willingness to make painful territorial concessions for peace [19]. That this withdrawal was followed by Hamas takeover and rocket attacks validates the security grammar's core premise: territorial concessions without security guarantees endanger Israeli civilians.

Counter-signal CS3 (settlement expansion during peace process) is processed as necessary hedging. Given Palestinian violence during negotiations, maintaining settlement presence ensures Israel retains bargaining leverage and security depth if talks fail. The 100% increase in settlers between 1993-2000 reflects natural growth and the need to maintain facts on the ground pending final status agreement [23].

The grammar achieves closure by demonstrating that Israeli actions, while regrettable in their human cost, represent rational security responses to genuine threats. The asymmetric casualty ratios (CS4) reflect Israel's investment in defensive systems (Iron Dome, bomb shelters) and military superiority, not disproportionate force. The continued settlement expansion despite international opposition demonstrates democratic sovereignty—Israeli voters consistently elect governments that prioritize security over international approval. The grammar's internal coherence derives from its consistent application of security logic: every signal, from checkpoints to casualties to legal rulings, is processed through the lens of threat mitigation and survival imperatives.

4.2 Legal-Humanitarian Grammar Processing (800-1500 words)

The Legal-Humanitarian Grammar processes the identical signal set through the framework of international law and human rights obligations, producing a fundamentally different narrative. Settlement expansion (S1) is immediately coded as illegal under Fourth Geneva Convention Article 49(6), which prohibits an occupying power from transferring its civilian population into occupied territory [13], [30]. The growth from 1 settlement to 125, with settler population reaching 325,456, represents systematic violation of international humanitarian law over five decades. Each settlement constitutes a distinct war crime under the Rome Statute.

This grammar emphasizes that UNSC Resolution 446 (1979) explicitly determined settlements have "no legal validity," yet expansion continued unabated [13]. The 100% increase in settlers during the Oslo peace process (1993-2000) demonstrates that diplomatic engagement provided cover for accelerated illegality [23]. The 41.9% of West Bank under settlement control represents not security architecture but illegal territorial acquisition prohibited by the Hague Regulations and Fourth Geneva Convention [30].

The casualty data (S2) is processed through proportionality and distinction principles. The First Intifada's 1,042 Palestinian deaths versus 118 Israeli deaths raises questions about excessive force against largely unarmed protesters. The Second Intifada's 3,808 Palestinian deaths, while occurring in more violent circumstances, still reflects a 3.8:1 ratio suggesting disproportionate response [30]. Operation Cast Lead's statistics are particularly damning: 1,378 Palestinian deaths including 733 non-combatants (320 children, 111 women) versus 13 Israeli deaths produces a 106:1 ratio that prima facie violates proportionality requirements [30].

The grammar highlights that 67 Palestinian mothers were forced to give birth at checkpoints between 2000-2005, resulting in 36 infant deaths—clear violations of the right to health and medical care under occupation law [30]. The 290 settler-related incidents in 2008 causing 131 Palestinian casualties, combined with an 8.5% indictment rate and less than 3% conviction rate, demonstrates systematic failure to protect occupied populations and prosecute violence [30].

The territorial control infrastructure (S3) is processed as collective punishment prohibited under Article 33 of the Fourth Geneva Convention. The ICJ's 2004 advisory opinion explicitly ruled the separation wall illegal, finding it violated international humanitarian law and human rights obligations [13], [14], [25]. Yet construction continued, with the wall reaching 700 kilometers, 85% within West Bank territory, effectively annexing land and separating Palestinians from their agricultural lands and water resources.

The 99 fixed checkpoints, 532 terrestrial obstacles, and 730 kilometers of road restrictions (120 km completely prohibited, 245 km partially prohibited, 365 km restricted) constitute a regime of movement restrictions that the ICJ found violated Palestinians' rights to work, health, education, and adequate standard of living [30]. These measures affect the entire Palestinian population, not just security threats, thus constituting collective punishment.

The governance fragmentation (S4) is interpreted as illegal annexation disguised as security arrangement. Area C's 59% of territory under full Israeli control, combined with settlement expansion within Area C, demonstrates that Oslo's "interim" arrangements have become permanent occupation [30]. The Palestinian Authority's control over only 18% of historic Palestine, fragmented into non-contiguous enclaves, prevents emergence of a viable state and violates the right to self-determination [10].

International legal rulings (S5) form the grammar's evidentiary foundation. UNSC Resolution 242 (1967) declared the occupation illegal and required withdrawal [4]. Resolution 446 (1979) determined settlements lack legal validity [13]. The ICJ's 2004 wall opinion found violations of humanitarian law and human rights [13], [25]. UNGA Resolution ES-10/15 (2004) demanded compliance [25]. The 2024 ICJ OPT opinion obligated all states not to recognize Israeli presence as legal [22]. This consistent legal record, spanning five decades and multiple international institutions, establishes clear illegality.

The grammar processes the peace process (S6) as demonstrating bad faith. Oslo (1993) was supposed to lead to Palestinian statehood within five years, yet settlement expansion accelerated during negotiations [10], [23]. Camp David II (2000) collapsed partly because Israel refused to accept the illegality of settlements and insisted on retaining major settlement blocs [10]. The Quartet Road Map (2003) explicitly called for a settlement freeze, yet construction continued [13], [19]. Annapolis (2007) produced no results [30]. The pattern suggests negotiations serve to maintain status quo while settlement expansion creates irreversible facts.

Counter-signal CS2 (legal compliance paradox) is central to this grammar's critique. Despite consistent international legal rulings declaring Israeli actions illegal, construction and settlement expansion continue. The ICJ's 2004 wall ruling was followed by continued construction to 700 kilometers [13], [25]. This demonstrates that international law lacks enforcement mechanisms against powerful states, revealing a structural weakness in the international legal order.

Counter-signal CS1 (Gaza disengagement) is processed as confirming the legal framework. Israel's 2005 withdrawal from Gaza demonstrates that settlements are reversible and that international pressure can produce compliance [19]. However, the grammar notes that Israel maintained control over Gaza's borders, airspace, and territorial waters, meaning the occupation continued in modified form, and the West Bank settlement expansion accelerated after Gaza withdrawal.

Counter-signal CS4 (asymmetric casualty ratios) provides quantitative evidence of disproportionality. The 106:1 ratio in Operation Cast Lead, with 733 non-combatants killed, suggests systematic failure to distinguish between military and civilian targets [30]. The grammar emphasizes that superior military technology creates greater obligations to minimize civilian harm, not license for higher casualties.

The grammar achieves closure by demonstrating systematic, sustained violations of international law over five decades, documented by the world's highest legal authorities, with no accountability. The 8.5% indictment rate for settler violence and less than 3% conviction rate exemplifies impunity [30]. The continued settlement expansion despite universal international condemnation shows contempt for legal

obligations. The grammar's coherence derives from consistent application of legal standards: every signal is evaluated against treaty obligations, customary international law, and authoritative judicial interpretations.

4.3 Structural-Colonial Grammar Processing (800-1500 words)

The Structural-Colonial Grammar processes the signal set through the framework of settler-colonialism, revealing patterns of demographic transformation and territorial displacement. Settlement expansion (S1) is decoded as the core colonial project: systematic transfer of settler population to achieve demographic dominance and territorial control. The trajectory from 1 settlement (1967) to 125 settlements (2012) with 325,456 settlers (2011) represents a deliberate colonization program [30]. The 100% increase in settlers during the Oslo "peace process" (1993-2000) demonstrates that diplomatic negotiations provided cover for accelerated colonization [23].

This grammar emphasizes the structural logic: settlements are not random security measures but strategically placed to fragment Palestinian territorial contiguity, control water resources, and create irreversible demographic facts. The 41.9% of West Bank under settlement control, with Area C comprising 59% of territory, reveals the colonial spatial strategy—indigenous population confined to disconnected enclaves while settlers control resources and movement corridors [30]. East Jerusalem's settler population growth from 118,100 (1989) to 184,707 (2007) represents Judaization of the city to prevent its role as Palestinian capital [30].

The casualty data (S2) is processed as structural violence inherent to colonial systems. The First Intifada's 1,042 Palestinian deaths represent indigenous resistance to colonization met with lethal force [30]. The Second Intifada's 3,808 Palestinian deaths versus 1,010 Israeli deaths reflects the asymmetric power relationship between colonizer and colonized [30]. Operation Cast Lead's 1,378 Palestinian deaths (733 non-combatants including 320 children) demonstrates the colonial state's willingness to inflict massive violence to maintain control [30].

The grammar highlights that 67 Palestinian mothers forced to give birth at checkpoints, resulting in 36 infant deaths, exemplifies how colonial control systems produce "ordinary" violence that kills without direct shooting [30]. The 290 settler-related incidents in 2008 causing 131 Palestinian casualties, with 8.5% indictment and less than 3% conviction rates, reveals settler impunity characteristic of colonial hierarchies where settler violence against indigenous populations goes unpunished [30].

The territorial control infrastructure (S3) is interpreted as apartheid-like spatial segregation. The 700-kilometer wall, 85% within West Bank territory, physically inscribes colonial boundaries [30]. The 99 fixed checkpoints and 532 terrestrial obstacles create a permit regime controlling Palestinian movement while settlers travel freely on separate road networks [30]. The 730 kilometers of road restrictions (120 km completely prohibited, 245 km partially prohibited, 365 km restricted for Palestinians) constitute a dual legal system based on ethnicity—the hallmark of apartheid [30].

This infrastructure serves colonial functions: fragmenting Palestinian space to prevent political organization, controlling labor flows to maintain economic dependency, and demonstrating state power through daily humiliation. The grammar notes that indigenous South Africans under apartheid faced similar pass systems and bantustans.

The governance fragmentation (S4) is decoded as colonial administrative structure. The Oslo division into Areas A/B/C mirrors colonial indirect rule: indigenous authorities (Palestinian Authority) manage population services in limited enclaves (Area A: 17.2% of territory) while the colonial power (Israel) retains security control and full authority over resource-rich areas (Area C: 59% of territory) [30]. The Palestinian Authority's control over only 18% of historic Palestine, fragmented into non-contiguous zones, prevents sovereign statehood while providing administrative services that relieve the occupying power of direct governance costs [10].

This grammar emphasizes that Oslo created a subcontracting arrangement where the PA polices its own population on behalf of Israeli security while Israel expands settlements. The 100% settler increase during Oslo demonstrates the colonial logic: negotiations maintain international legitimacy while colonization accelerates [23].

International legal rulings (S5) are processed as insufficient without structural transformation. While UNSC Resolution 242 (1967), Resolution 446 (1979), and ICJ opinions (2004, 2024) declare Israeli actions illegal, the grammar notes that international law developed within colonial contexts and often legitimized colonialism [4], [13], [22], [25]. The Fourth Geneva Convention's prohibition on population transfer was designed for temporary occupations, not settler-colonial projects designed for permanence [13], [30].

The grammar highlights that South African apartheid was also condemned by international law, yet only sustained resistance and economic pressure produced change. Legal rulings without enforcement mechanisms cannot dismantle colonial structures. The continued settlement expansion despite five decades of legal condemnation proves this point.

The peace process (S6) is interpreted as colonial management strategy. Oslo (1993) did not envision dismantling settlements but rather Palestinian acceptance of major settlement blocs [10], [23]. Camp David II (2000) offered Palestinian "statehood" on 88-92% of West Bank—meaning acceptance of 8-12% territorial loss to settlements [10]. The Quartet Road Map (2003) and Annapolis (2007) similarly assumed settlement retention [13], [19], [30].

The grammar argues that the "peace process" serves colonial functions: maintaining international legitimacy, dividing Palestinian leadership between "moderates" willing to negotiate and "extremists" who resist, and buying time for settlement expansion. The 100% settler increase during Oslo proves negotiations enable rather than constrain colonization [23].

Counter-signal CS1 (Gaza disengagement) is processed as colonial restructuring, not decolonization. Israel's 2005 evacuation of 8,000 Gaza settlers while expanding West Bank settlements (which reached 325,456 by 2011) represents strategic redeployment [19], [30]. Gaza's 1.8 million Palestinians confined to 365 square kilometers became a liability; withdrawing settlers while maintaining border control, airspace, and territorial waters allowed Israel to deny occupation responsibility while intensifying West Bank colonization.

Counter-signal CS3 (settlement expansion during peace process) is central evidence for this grammar. The 100% settler increase between 1993-2000 demonstrates that negotiations provide cover for colonization [23]. Every peace process phase—Oslo, Camp David, Road Map, Annapolis—coincided with settlement expansion, proving that diplomatic engagement serves colonial consolidation.

Counter-signal CS4 (asymmetric casualty ratios) quantifies colonial violence. The Second Intifada's 3.8:1 ratio and Operation Cast Lead's 106:1 ratio reflect the power asymmetry between colonial state and colonized population [30]. The grammar notes that French colonial forces in Algeria, British forces in Kenya, and other colonial powers produced similar asymmetric casualties when facing indigenous resistance.

The grammar achieves closure by demonstrating that all signals—settlements, casualties, infrastructure, governance, legal rulings, peace processes—form a coherent colonial pattern. The 6.6 million Palestinian refugees and 427,000 internally displaced (67% of total Palestinian population) represent the demographic displacement central to settler-colonialism [13]. The 41.9% of West Bank under settlement control and 59% in Area C show territorial appropriation [30]. The dual legal system (8.5% indictment rate for settler violence) reveals colonial hierarchy [30]. The grammar's coherence derives from recognizing structural patterns that transcend individual events: this is not a "conflict" between equal parties but a colonial project of displacement and replacement.

---

5. Closure Comparison (500-800 words)

The three grammars process identical empirical signals into fundamentally incommensurable closure states, revealing the prismatic nature of the Israeli-Palestinian conflict. Each grammar achieves internal coherence while producing mutually exclusive interpretations of the same data.

The Security-Sovereignty Grammar achieves closure through threat validation. The settlement expansion from 1 to 125 settlements with 325,456 settlers becomes security infrastructure; the 3,808 Palestinian and 1,010 Israeli deaths in the Second Intifada validate security imperatives; the 700-kilometer wall and 99 checkpoints represent necessary defensive measures [30]. Gaza disengagement's failure—withdrawal followed by Hamas takeover and rocket attacks—proves that territorial concessions without security guarantees endanger Israeli civilians [19]. This grammar's closure criterion is security achievement through territorial control, validated by democratic mandate within Israeli polity. It succeeds by demonstrating rational state behavior under existential threat.

The Legal-Humanitarian Grammar achieves closure through illegality documentation. The same settlement expansion violates Fourth Geneva Convention Article 49(6) and UNSC Resolution 446; the same casualties demonstrate disproportionate force (106:1 ratio in Operation Cast Lead with 733 non-combatants killed); the same wall was ruled illegal by the ICJ in 2004 [13], [14], [25], [30]. Five decades of consistent international legal rulings—from UNSC Resolution 242 (1967) to the ICJ OPT opinion (2024)—establish systematic violation of international law [4], [22]. This grammar's closure criterion is legal compliance, validated by authoritative international institutions. It succeeds by demonstrating sustained illegality and impunity (8.5% indictment rate for settler violence) [30].

The Structural-Colonial Grammar achieves closure through pattern recognition. The same settlement expansion represents demographic colonization; the same casualties reflect colonial violence (3.8:1 and 106:1 ratios); the same wall and checkpoints constitute apartheid-like spatial segregation [30]. The 100% settler increase during the Oslo "peace process" (1993-2000) proves negotiations enable colonization [23]. The governance fragmentation—Area C comprising 59% of territory under full Israeli control, PA controlling only 18% of historic Palestine—mirrors colonial indirect rule [10], [30]. This grammar's closure criterion is structural transformation, validated by decolonization precedents. It succeeds by demonstrating colonial patterns: 6.6 million refugees, 41.9% of West Bank under settlement control, dual legal system with settler impunity [13], [30].

The grammars' incommensurability appears starkly in their processing of counter-signals. Gaza disengagement (CS1) proves Israeli willingness to make territorial concessions (Security-Sovereignty), confirms settlements are reversible under pressure (Legal-Humanitarian), or represents colonial restructuring rather than decolonization (Structural-Colonial) [19]. Settlement expansion during peace process (CS3) reflects necessary hedging (Security-Sovereignty), demonstrates bad faith (Legal-Humanitarian), or proves negotiations enable colonization (Structural-Colonial) [23].

The asymmetric casualty ratios (CS4) illustrate fundamental incompatibility. The Second Intifada's 3,808 Palestinian versus 1,010 Israeli deaths and Operation Cast Lead's 106:1 ratio with 733 non-combatants killed are processed as: evidence of Israeli defensive superiority and Palestinian use of human shields (Security-Sovereignty); prima facie violations of proportionality and distinction principles (Legal-Humanitarian); or quantification of colonial violence against indigenous resistance (Structural-Colonial) [30].

Each grammar's closure is internally coherent but externally incompatible. The Security-Sovereignty Grammar cannot accommodate the Legal-Humanitarian Grammar's insistence that security imperatives do not override legal obligations. The Legal-Humanitarian Grammar cannot accommodate the Structural-Colonial Grammar's claim that legal frameworks are insufficient without structural transformation.

The Structural-Colonial Grammar cannot accommodate the Security-Sovereignty Grammar's symmetrical conflict framing.

This incommensurability explains resolution failure. Negotiations assume shared interpretive framework, but the grammars process even negotiation outcomes differently. Oslo (1993) represents Israeli concessions met with terrorism (Security-Sovereignty), bad faith cover for settlement expansion (Legal-Humanitarian), or colonial management strategy (Structural-Colonial) [10], [23]. Camp David II (2000) represents generous Israeli offer rejected by Palestinians (Security-Sovereignty), Israeli refusal to accept settlement illegality (Legal-Humanitarian), or colonial offer of bantustans rather than sovereignty (Structural-Colonial) [10].

The prismatic analysis reveals that the conflict persists not because of information deficits—all parties access the same empirical data—but because of incommensurable interpretive frameworks. The 125 settlements, 325,456 settlers, 4,818 deaths, 700-kilometer wall, and five decades of legal rulings are processed into three mutually exclusive narratives [30]. Resolution requires not more data but recognition that different grammars produce different realities from identical signals.

---

6. Counter-Signal Analysis and Leakage

Counter-signals reveal the boundaries and vulnerabilities of each grammar's interpretive framework. Their analysis exposes "leakage"—empirical data that resists assimilation and threatens grammatical coherence.

CS1: Gaza Disengagement (2005) creates maximum leakage for the Structural-Colonial Grammar. Israel's evacuation of 8,000 settlers from 21 Gaza settlements contradicts the claim that settler-colonialism is irreversible without sustained resistance [19]. If colonization is structural and permanent, voluntary withdrawal becomes anomalous. The grammar must reframe disengagement as strategic redeployment—abandoning Gaza's 1.8 million Palestinians in 365 square kilometers while intensifying West Bank colonization (settlers grew to 325,456 by 2011) [30]. Yet this reframing acknowledges that colonial projects can reverse course, weakening structural determinism.

For the Security-Sovereignty Grammar, Gaza disengagement provides powerful validation: Israel made painful territorial concessions for peace, only to face Hamas takeover and rocket attacks, proving that withdrawal without security guarantees endangers civilians [19]. However, this creates leakage around the claim that settlements are security necessities—if Gaza settlements were evacuable, why are West Bank settlements permanent? The grammar must distinguish between strategic depth (West Bank) and indefensible enclaves (Gaza), but this admits that some settlements lack security justification.

The Legal-Humanitarian Grammar processes Gaza disengagement as confirming that settlements are reversible and international pressure works [19]. Yet leakage appears: if Israel can withdraw from Gaza, why does international law lack enforcement mechanisms for West Bank settlements? The grammar must acknowledge that legal rulings without enforcement produce selective compliance.

CS2: Legal Compliance Paradox creates maximum leakage for the Legal-Humanitarian Grammar. Five decades of consistent international legal rulings—UNSC Resolution 242 (1967), Resolution 446 (1979), ICJ wall opinion (2004), ICJ OPT opinion (2024)—declared Israeli actions illegal, yet settlement expansion continued from 1 to 125 settlements with 325,456 settlers [4], [13], [22], [25], [30]. The wall reached 700 kilometers despite the ICJ ruling it illegal [30]. This exposes international law's structural weakness: authoritative rulings without enforcement mechanisms cannot constrain powerful states.

The grammar must either acknowledge that international law is ineffective against powerful actors (undermining its normative authority) or argue that sustained non-compliance delegitimizes the violating

state (but Israel maintains strong international relationships). The leakage reveals that legal frameworks assume state consent and lack coercive enforcement.

For the Security-Sovereignty Grammar, the legal compliance paradox validates sovereignty claims: democratic states retain the right to self-defense even when international institutions disagree. However, this creates leakage around the claim that Israeli actions are legally justified—if they were legal, why do all international legal authorities rule otherwise? The grammar must dismiss international law as biased or irrelevant, but this isolates Israel from the international legal order.

The Structural-Colonial Grammar processes the paradox as confirming that international law, developed within colonial contexts, cannot dismantle colonial structures [13]. Yet this creates leakage: if legal frameworks are inherently inadequate, why cite ICJ rulings and UN resolutions as evidence? The grammar must use legal rulings instrumentally while denying their sufficiency.

CS3: Settlement Expansion During Peace Process creates maximum leakage for the Security-Sovereignty Grammar. The 100% increase in settlers between 1993-2000 during Oslo negotiations contradicts the claim that Israel seeks peace through territorial compromise [23]. If settlements are security necessities, why expand during peace talks? If they are bargaining chips, why double the settler population? The grammar must frame expansion as hedging against negotiation failure, but this admits that Israel pursued contradictory policies—negotiating withdrawal while expanding presence.

For the Structural-Colonial Grammar, this counter-signal provides powerful validation: negotiations enable colonization by maintaining international legitimacy while settlement expansion creates irreversible facts [23]. However, minimal leakage appears: if the peace process is purely colonial management, why did Israel offer territorial concessions at Camp David II? The grammar must argue offers were insufficient (bantustans not sovereignty), but this acknowledges some Israeli flexibility.

The Legal-Humanitarian Grammar processes this as demonstrating bad faith—the Quartet Road Map (2003) explicitly called for settlement freeze, yet construction continued [13], [19]. Yet leakage appears: if the peace process was bad faith, why did Palestinians continue participating? The grammar must acknowledge Palestinian agency and strategic calculations beyond victimhood.

CS4: Asymmetric Casualty Ratios creates leakage for the Security-Sovereignty Grammar. The Second Intifada's 3.8:1 Palestinian-to-Israeli death ratio and Operation Cast Lead's 106:1 ratio (1,378 Palestinians including 733 non-combatants versus 13 Israelis) challenge the symmetrical conflict framing [30]. If this is a security dilemma between equal parties, why such asymmetric casualties? The grammar must attribute asymmetry to Israeli defensive investments (Iron Dome, shelters) and Palestinian use of human shields. Yet the 733 non-combatants killed in Operation Cast Lead, including 320 children, strain this explanation [30].

For the Legal-Humanitarian Grammar, asymmetric ratios provide quantitative evidence of disproportionality and distinction violations. However, leakage appears: international humanitarian law permits asymmetric casualties if military necessity justifies them. The grammar must prove that 733 non-combatant deaths were not militarily necessary, requiring detailed operational analysis often unavailable.

The Structural-Colonial Grammar processes asymmetric ratios as quantifying colonial violence—3.8:1 and 106:1 ratios reflect power asymmetry between colonizer and colonized [30]. Minimal leakage appears, though the grammar must explain why colonial powers sometimes face higher casualties (French in Algeria, US in Vietnam).

CS5: Judicial System Ineffectiveness creates leakage for all grammars. The 8.5% indictment rate for 938 settler violence investigations and less than 3% conviction rate reveal systematic impunity [30]. For the Security-Sovereignty Grammar, this contradicts the claim that Israel is a democratic state governed by rule of law. The grammar must acknowledge judicial failures while arguing they are aberrations, not systemic—but 8.5% indictment rate suggests systemic dysfunction.

For the Legal-Humanitarian Grammar, this demonstrates accountability failure, but creates leakage: if domestic legal systems are inadequate, why not invoke International Criminal Court jurisdiction? The grammar must acknowledge political constraints on international justice.

For the Structural-Colonial Grammar, this confirms colonial hierarchy—settler violence against indigenous populations goes unpunished [30]. However, leakage appears: some settlers are prosecuted (8.5% indicted), suggesting the system is dysfunctional rather than purely colonial. The grammar must explain why colonial systems maintain formal legal structures that occasionally function.

Counter-signal analysis reveals that no grammar fully contains the empirical data. Each experiences leakage where signals resist assimilation, exposing interpretive boundaries and internal tensions. The prismatic method's value lies in making this leakage visible, demonstrating that interpretive frameworks are not neutral data processors but selective filters that privilege certain signals while struggling to accommodate others.

---

7. Reflexive Note (200-300 words)

Conducting this prismatic analysis required sustained reflexive awareness of my own interpretive tendencies and the methodological challenges inherent in meta-analytical work. As the analyst, I found myself repeatedly drawn toward the Legal-Humanitarian Grammar, likely reflecting my training in international relations and human rights frameworks. The grammar's reliance on authoritative institutional rulings (ICJ, UNSC) and codified legal standards provided cognitive comfort—clear criteria for evaluating claims and determining validity.

This gravitational pull toward legal frameworks revealed a deeper methodological tension: the prismatic method requires simultaneous inhabitation of multiple incommensurable grammars while maintaining analytical distance from all of them. I noticed that when processing signals through the Security-Sovereignty Grammar, I experienced cognitive resistance—the transformation of 733 non-combatant deaths into "necessary costs of self-defense" felt morally uncomfortable [30]. Conversely, when processing through the Structural-Colonial Grammar, I felt intellectual satisfaction at pattern recognition—the 100% settler increase during Oslo negotiations elegantly confirmed the colonial management hypothesis [23].

These affective responses are themselves data points, revealing how grammars operate not only through logical rules but through emotional resonances and moral intuitions. The Security-Sovereignty Grammar appeals to those who prioritize state survival and democratic sovereignty; the Legal-Humanitarian Grammar to those who privilege universal norms and institutional authority; the Structural-Colonial Grammar to those who recognize historical patterns of dispossession.

The most challenging aspect was resisting the urge to adjudicate between grammars—to declare one "correct" and others "distorted." The prismatic method's value lies precisely in suspending this judgment, demonstrating that incommensurable frameworks can each achieve internal coherence while producing mutually exclusive interpretations. This suspension is intellectually demanding and emotionally unsatisfying, as it denies the closure that comes from declaring truth. Yet this discomfort is the method's insight: the conflict persists because multiple coherent but incompatible realities coexist, each validated by its own grammar's processing of empirical signals.

---

8. Methodological Observations

The application of Jazinski's Prismatic Method to the Israeli-Palestinian conflict yields several methodological insights about interpretive frameworks, empirical data, and conflict analysis.

Empirical Density and Interpretive Flexibility: The conflict provides exceptionally rich empirical data—precise settlement statistics (1 to 125 settlements, 4,400 to 325,456 settlers), casualty figures (3,808 Palestinian and 1,010 Israeli deaths in Second Intifada), infrastructure metrics (700-kilometer wall, 99 checkpoints, 532 obstacles), and legal rulings spanning five decades [30]. Yet this empirical density does not constrain interpretation. Instead, each grammar transforms identical data into supporting evidence for incompatible conclusions. The 100% settler increase during Oslo negotiations (1993-2000) proves Israeli commitment to peace (Security-Sovereignty), bad faith (Legal-Humanitarian), or colonial management (Structural-Colonial) [23]. This demonstrates that empirical richness does not reduce interpretive variance—grammars are not data-constrained but data-transforming.

Counter-Signals as Grammar Stress Tests: Counter-signals proved more analytically valuable than core signals. Gaza disengagement (CS1), legal compliance paradox (CS2), and settlement expansion during peace process (CS3) exposed grammatical boundaries and leakage points [19], [23]. Each grammar struggled to assimilate specific counter-signals: Gaza disengagement challenged Structural-Colonial determinism, legal compliance paradox exposed Legal-Humanitarian enforcement weakness, settlement expansion during negotiations undermined Security-Sovereignty peace commitment claims. This suggests that conflict analysis should prioritize anomalies over pattern confirmation—counter-signals reveal interpretive limits more effectively than supporting evidence.

Temporal Dynamics and Grammar Evolution: The 59-year timeframe (1967-2026) revealed grammar evolution. The Security-Sovereignty Grammar's processing of the First Intifada (1987-1993: 1,042 Palestinian deaths) differed from its processing of Operation Cast Lead (2008-2009: 1,378 Palestinian deaths including 733 non-combatants) [30]. Early in the occupation, security justifications emphasized temporary military necessity; by 2008, they incorporated permanent threat narratives. Similarly, the Legal-Humanitarian Grammar's reliance on ICJ rulings intensified after the 2004 wall opinion, while the Structural-Colonial Grammar gained prominence after Oslo's failure. This temporal dimension suggests grammars are not static but evolve in response to empirical developments and prior interpretive failures.

Institutional Authority and Grammar Legitimation: The three grammars derive legitimacy from different institutional sources. The Security-Sovereignty Grammar appeals to democratic mandates within Israeli polity—voters consistently elect governments prioritizing security over international approval. The Legal-Humanitarian Grammar appeals to international legal institutions—UNSC, ICJ, Fourth Geneva Convention [4], [13], [22], [25]. The Structural-Colonial Grammar appeals to historical precedents—decolonization movements, anti-apartheid struggle. This institutional pluralism explains why empirical evidence cannot adjudicate between grammars: each is validated by different authority structures that do not recognize each other's primacy.

Quantification and Moral Framing: Casualty statistics illustrate how quantification interacts with moral framing. The Second Intifada's 3,808 Palestinian and 1,010 Israeli deaths can be expressed as 3.8:1 ratio, 4,818 total deaths, or 3,808 versus 1,010 [30]. Each formulation privileges different moral intuitions: ratios emphasize asymmetry, totals emphasize shared tragedy, separate figures emphasize distinct communities. Operation Cast Lead's 106:1 ratio (1,378 Palestinian versus 13 Israeli deaths) becomes even more morally charged when disaggregated: 733 non-combatants including 320 children and 111 women [30]. The Legal-Humanitarian Grammar privileges disaggregation to assess proportionality and distinction; the Security-Sovereignty Grammar privileges aggregation to emphasize total threat; the Structural-Colonial Grammar privileges ratios to quantify power asymmetry. This demonstrates that quantification does not neutralize moral framing but embeds it in methodological choices.

Spatial Metrics and Territorial Ontology: The conflict's spatial dimensions—41.9% of West Bank under settlement control, Area C comprising 59% of territory, 700-kilometer wall with 85% within West Bank—reveal how grammars construct territorial ontology [30]. The Security-Sovereignty Grammar

processes these as security architecture (buffer zones, strategic depth). The Legal-Humanitarian Grammar processes them as illegal territorial acquisition. The Structural-Colonial Grammar processes them as colonial spatial segregation. Each grammar thus constructs different territorial realities from identical spatial data, demonstrating that territory is not a neutral substrate but an interpreted phenomenon.

Peace Process as Interpretive Battleground: The peace process milestones—Oslo (1993), Camp David II (2000), Road Map (2003), Annapolis (2007)—function as interpretive battlegrounds where grammars compete [10], [13], [19], [20], [30]. Each negotiation round generates empirical data (agreements signed, territorial offers, negotiation failures) that all grammars must process. Yet they produce incompatible narratives: Israeli good faith met with Palestinian rejectionism (Security-Sovereignty), Israeli bad faith masked by diplomatic theater (Legal-Humanitarian), colonial management maintaining international legitimacy (Structural-Colonial). This suggests that diplomatic processes do not resolve interpretive conflicts but intensify them by generating new empirical data requiring grammatical assimilation.

Limitations of Meta-Analysis: The prismatic method's meta-analytical stance—examining how grammars process signals rather than adjudicating between them—has inherent limitations. By suspending judgment about which grammar is "correct," the method may appear to relativize truth claims and moral distinctions. The 733 non-combatants killed in Operation Cast Lead, including 320 children, are not merely interpretive constructs but human deaths with moral weight [30]. The method risks aestheticizing violence by treating it as data for grammatical analysis. This limitation is not resolvable within the method but must be acknowledged: meta-analysis illuminates interpretive dynamics but cannot replace moral judgment or political commitment.

Implications for Conflict Resolution: The prismatic analysis suggests that traditional conflict resolution approaches—which assume shared reality and seek compromise—are inadequate when parties operate within incommensurable grammars. Negotiations presume that empirical evidence (casualty statistics, legal rulings, territorial data) can adjudicate disputes, but the analysis demonstrates that identical evidence is processed into incompatible conclusions. Resolution may require not compromise within a shared framework but explicit negotiation between frameworks—meta-negotiation about which grammar will govern interpretation. Alternatively, resolution may require one grammar's dominance through political, military, or economic power rather than interpretive persuasion. The prismatic method cannot prescribe solutions but clarifies why solutions have proven elusive: the conflict is not primarily about disputed facts but about incommensurable interpretive frameworks that transform facts into incompatible realities.
