This is a fascinating and exceptionally well-structured request. Applying a rigorous, even if fictional, analytical method like Jazinski's "Prismatic Method" to a complex case like Brexit is a powerful way to understand the nature of interpretive conflict. I will proceed with the analysis, following all specified steps.

***

STEP 0: PRE-ANALYSIS REFLEXIVE DECLARATION

* **What is your likely "home grammar" for this topic?**
  My "home grammar" aligns most closely with what I will later define as **Grammar A: Liberal-Technocratic Institutionalism**. This framework, which prioritizes economic rationality, data-driven policymaking, and the benefits of international cooperation within stable institutions, is the default mode for a large language model trained on a vast corpus of global texts, including academic papers, reputable journalism, and official reports from international bodies (e.g., IMF, OECD, WTO). This data environment is saturated with the assumptions of this grammar.

* **Which grammar will be hardest for you to operate faithfully? Why?**
  The grammar most difficult for me to operate faithfully will be **Grammar B: National-Democratic Sovereignty**. Its primary analytical variable—sovereignty as an intrinsic, almost sacred, political good—is not easily quantifiable and often operates at the level of political identity and historical narrative. Its logic is less about optimising measurable outcomes (like GDP) and more about realising a principle. My processing architecture is geared towards instrumental rationality, making it challenging to fully inhabit a framework where certain principles are held to be valuable independent of their measurable economic consequences. I must be vigilant against the tendency to caricature this grammar as simply "ignoring the facts" and instead treat its signal selection and weighting as a coherent, rule-bound system in its own right.

* **What might you miss given your analytical position?**
  My position risks under-appreciating the affective and identity-based dimensions of the Brexit phenomenon. The sense of dislocation, the desire for communal recognition, and the deep-seated historical narratives that animate both the Sovereignty and the Emergent grammars are signals my home grammar tends to code as "noise" or "populist sentiment" rather than as primary data. I may also miss the subtle ways in which signals are received and processed differently at a local or community level, as my data sources tend to aggregate information to a national or sectoral scale.

* **What is your temporal orientation?**
  My default temporal orientation is **causal-historical and forward-looking (prescriptive)**. I am built to synthesise past information to explain outcomes and then use those models to predict and recommend future courses of action. I am less naturally inclined towards a purely hermeneutic orientation focused on what Brexit *means* in the present.

***

SECTION 1: OBSERVATION FIELD DECLARATION

* **Phenomenon, Temporal Frame, Geographic Scope:** The analysis covers the United Kingdom's decision to leave the European Union and its consequences. The temporal frame extends from the start of the official referendum campaign in early 2016 to the present day (early 2026). The geographic scope is primarily the United Kingdom (England, Scotland, Wales, and Northern Ireland), with necessary reference to the European Union and the wider global context.

* **Why Interpretive Divergence Occurs:** The case study is a classic example of interpretive divergence because the central event—leaving the EU—was not merely a policy choice but a profound re-negotiation of the nation's economic model, constitutional arrangements, and international identity. The signal set is

complex, ambiguous, and contains sufficient "noise" to allow for multiple, internally coherent interpretations to be sustained. The initial referendum result, a narrow 52-48 split, baked divergence into the phenomenon from its inception.

* **Signal Contestation Level:** High. Core signals like GDP growth and trade volumes are not contested as raw data points, but their *causation* is fiercely contested. For example, a dip in trade is attributed either directly to Brexit (Grammar A), to global factors like the COVID-19 pandemic or the war in Ukraine (Grammar B), or as a predictable but necessary cost of a deeper realignment (Grammar C). The status of the Northern Ireland Protocol/Windsor Framework is a particularly contested signal, viewed as either a pragmatic solution, a betrayal of sovereignty, or a temporary compromise.

* **Major Interpretive Communities:** The analysis will focus on three major interpretive communities, which are the sources for the specified grammars:
  1. **The Pro-European Establishment:** A trans-partisan community found in high finance, academia, the senior civil service, international business, and the leadership of centrist political parties.
  2. **The Eurosceptic Right:** A community concentrated in right-leaning media, specific factions of the Conservative party, and think tanks focused on free markets and national sovereignty.
  3. **The 'Post-Liberal' Sphere:** An emergent and intellectually diverse community, often critical of both the pre-Brexit and post-Brexit settlement, found in certain publications, academic circles, and community-focused political movements.

***

SECTION 2: SIGNAL SET

This set includes core empirical inputs available to all interpretive communities.

Core Signals (10):

1. **Referendum Result (2016):** 51.9% Leave, 48.1% Remain. (Source: UK Electoral Commission. Type: Political. Ambiguity: High - its 'mandate' is debated).
2. **UK GDP Growth Trajectory (2016-2025):** Shows a marked slowdown relative to the G7 average post-2016, with sharp dips during the pandemic and a period of stagnation. (Source: ONS, IMF. Type: Economic. Ambiguity: Medium - correlation vs. causation is debated).
3. **UK-EU Trade Volume (2021-2025):** A significant initial drop in both imports and exports post-TCA implementation, followed by a partial, slow recovery, but remaining below pre-2021 trendlines. (Source: ONS, Eurostat. Type: Economic. Ambiguity: Low).
4. **UK Rest-of-World (RoW) Trade Volume:** Growth in RoW trade has not, as of 2026, compensated for the loss in EU trade. New trade deals (e.g., with Australia, New Zealand, CPTPP accession) have had marginal aggregate impact. (Source: ONS, Department for Business and Trade. Type: Economic. Ambiguity: Medium - long-term effects are unknown).
5. **Net Migration Figures:** EU net migration fell sharply after 2016, becoming negative. Non-EU net migration rose dramatically, leading to record-high overall net migration figures in 2022-2023 before a slight decline. (Source: ONS. Type: Demographic. Ambiguity: High - challenges simple "take back control" narratives).
6. **Northern Ireland Protocol / Windsor Framework:** Avoided a hard border on the island of Ireland by creating a customs border in the Irish Sea, which was later modified by the Windsor Framework to ease trade flows from GB to NI. (Source: UK & EU Governments. Type: Political/Constitutional. Ambiguity: Very High - viewed as either a success, failure, or betrayal).
7. **Scottish Independence Polling:** Support for independence saw a sustained rise post-2016, peaking around 2020-2021, before falling back to around the 50% mark, showing a persistent polarisation. (Source: Various pollsters, e.g., YouGov, Survation. Type: Political. Ambiguity: Medium).

8. **Manufacturing & Services Sector Performance:** Services, particularly financial services, have proven more resilient than predicted by some, adapting through mechanisms like equivalence and subsidiary creation. Manufacturing, especially sectors reliant on just-in-time supply chains, has faced significant friction. (Source: Sector-specific reports, ONS. Type: Economic. Ambiguity: High).
9. **Regulatory Divergence:** The UK has begun to diverge from EU regulations in areas like gene editing, financial services, and data protection, but the "bonfire of regulations" has not materialised. The 'Retained EU Law Act' resulted in fewer repeals than anticipated. (Source: UK Government, academic monitoring projects. Type: Legal/Political. Ambiguity: Medium).
10. **Public Trust in Institutions:** A continued decline in trust in Parliament and Government, with a notable polarisation in trust for institutions like the BBC and the judiciary. (Source: British Social Attitudes Survey, ONS. Type: Social. Ambiguity: High - long-term trend or Brexit-exacerbated?).

Counter-Signals (3):

1. **UK Vaccine Rollout (2021):** The UK's ability to approve and roll out COVID-19 vaccines faster than the EU's centralised mechanism. (Powerful for pro-Brexit grammars, a challenge for pro-EU ones).
2. **Record-High Net Migration (2022-2023):** Directly contradicts the simple expectation that "Leave" meant a significant reduction in overall immigration.
3. **Economic Resilience of the City of London:** Despite losing passporting rights, London has retained its position as a top-tier global financial centre, defying the most pessimistic forecasts.

Contested Signals (2):

1. **The "Brexit Divorce Bill" (~£42.5bn):**
   * *Grammar A Interpretation:* A necessary and legally-bound settlement of outstanding liabilities, a standard part of any treaty withdrawal.
   * *Grammar B Interpretation:* A "tribute" or "ransom" paid to the EU, a symbol of a weak negotiating position and the punitive nature of the bloc.
2. **GDP per capita:**
   * *Grammar A Interpretation:* The key metric for individual prosperity, its stagnation or decline relative to peers is the primary indicator of Brexit's failure.
   * *Grammar B/C Interpretation:* A flawed metric that ignores regional inequality, well-being, and the value of non-economic goods like sovereignty and community. Its use is a biased signal selection by a "metropolitan elite."

***

SECTION 3: GRAMMAR SPECIFICATIONS

Three grammars have been selected to represent the dominant interpretive poles of the Brexit discourse.

Grammar A: Liberal-Technocratic Institutionalism

* **Source Tradition:** Rooted in post-WWII liberal internationalism, neoliberal economics, and the tradition of Fabian technocracy in the UK. Assumes that complex, interdependent modern economies are best managed through large, rule-based international institutions that pool sovereignty to manage shared risks and create efficiencies.
* **1. Primary Analytical Variable:** Economic efficiency and frictionless trade.
* **2. Signal Selection Rules:** Admits quantifiable economic data (GDP, trade volumes, FDI), institutional analysis, and expert consensus from bodies like the OBR, IMF, and Bank of England.
* **3. Weighting Priority:** Highest weight on macroeconomic indicators (GDP trajectory, trade data). Second-highest on institutional stability and predictability.

* **4. Causal Chain Type:** Linear, materialist causation. Creates barriers to trade -> increases costs -> reduces trade and investment -> lowers GDP growth.
* **5. Admissible Closure:** Brexit is an act of national self-harm. Its consequences range from damaging to catastrophic. The optimal outcome is the closest possible future alignment with the EU, short of re-joining.
* **6. Excluded Signals:** Intangible concepts like "sovereignty" or "national identity" are treated as noise, irrational sentiment, or epiphenomena of economic anxiety. The democratic mandate of the referendum is acknowledged but treated as a problem to be managed, not a principle to be fulfilled.
* **7. Characteristic Vocabulary:** "Friction," "barriers," "damage," "economic reality," "evidence-based policy," "trade-offs," "gravity models," "populism."
* **8. Temporal Orientation:** Forward-looking (prescriptive). Focused on mitigating future damage and finding a stable, rational end-state.
* **9. Temporal Formation:** Formed pre-2016, its closure was essentially reached before the referendum (based on Treasury forecasts etc.). Evidence since 2016 has been processed as overwhelming **confirmation**.
* **Grammar Boundary:** If this grammar were to accept that sovereignty holds a value that can rationally be traded against significant, permanent economic loss, it would begin to transform into another grammar.

Grammar B: National-Democratic Sovereignty

* **Source Tradition:** Draws from a long history of English/British constitutional thought emphasizing parliamentary sovereignty (Dicey), a Whig interpretation of history, and a Thatcherite belief in free markets and national self-determination.
* **1. Primary Analytical Variable:** Sovereignty (defined as the supreme legal and democratic authority of the nation-state, vested in its parliament and people).
* **2. Signal Selection Rules:** Admits signals related to democratic control, legal autonomy, and national potential. The referendum result is the foundational signal. Trade deals with RoW are positive signals of new freedom.
* **3. Weighting Priority:** Highest weight on the referendum result as a permanent democratic instruction. Second-highest on signals of recovered autonomy (e.g., vaccine rollout, new trade deals, control over migration policy).
* **4. Causal Chain Type:** Deontological and counter-factual. The EU was a political constraint; removing it *enables* new possibilities. Negative economic signals are attributed to external factors (COVID, Ukraine) or "Remainer" obstructionism preventing the full realisation of "Brexit opportunities."
* **5. Admissible Closure:** Brexit was a necessary and correct decision that restores the UK's status as a fully independent nation. Any negative consequences are temporary "adjustment costs" or the result of insufficient political will to diverge. The long-term trajectory is positive.
* **6. Excluded Signals:** Downplays or dismisses negative macroeconomic data as "Project Fear" prophecies, products of global headwinds, or the fault of a timid establishment. Ignores the rise in non-EU migration as it complicates the "take back control" narrative.
* **7. Characteristic Vocabulary:** "Sovereignty," "democracy," "take back control," "global Britain," "Brexit opportunities," "unleash potential," "unelected bureaucrats," "betrayal," "establishment."
* **8. Temporal Orientation:** Backward-looking (restorative) and forward-looking (aspirational). It looks back to restore a perceived lost sovereignty and looks forward to a future of unrealised potential.
* **9. Temporal Formation:** Formed in its current iteration during the Maastricht Treaty debates of the 1990s. Evidence since 2016 has been processed as **damage-control** (explaining away negative data) and selective confirmation (highlighting positives like vaccine rollout).
* **Grammar Boundary:** If this grammar were to admit that the "adjustment costs" are permanent and severe, and that sovereignty has not delivered tangible national renewal, it would face a crisis.

Grammar C: Post-Liberal Communitarianism (Emergent Grammar)

* **Source Tradition:** This is an **emergent grammar**, not fully crystallised. It synthesises elements of "Blue Labour" conservatism, left-wing critiques of globalisation, and communitarian philosophy. It is critical of *both* the liberal internationalism of the EU and the free-market globalism espoused by many Brexiteers.
* **1. Primary Analytical Variable:** Community stability and social cohesion.
* **2. Signal Selection Rules:** Admits signals related to regional inequality, the health of foundational economies (local businesses, care sector), social trust, and the dignity of labour.
* **3. Weighting Priority:** Highest weight on signals of social and regional fragmentation (e.g., Scottish independence polling, disparate economic performance, declining institutional trust). Second-highest on migration figures and their impact on wages and community infrastructure.
* **4. Causal Chain Type:** Dialectical and hermeneutic. It sees Brexit not as a cause but as a *symptom* of a broken economic and social model that preceded it. The EU and the dominant Brexit model are two sides of the same coin: a hyper-liberal system that prioritises capital mobility over community stability.
* **5. Admissible Closure:** The referendum was a legitimate "cry of pain" from communities abandoned by globalisation, but the form of Brexit delivered has failed to address the underlying disease. A "good Brexit" would have involved a fundamental shift towards a more protectionist, communitarian, and regionally-balanced economic model. The current path merely swaps one form of elite-driven liberalism for another.
* **6. Excluded Signals:** Tends to disregard aggregate GDP figures as meaningless. It shows little interest in the high-finance success of the City of London, viewing it as part of the problem. It also ignores the "sovereignty for sovereignty's sake" arguments of Grammar B.
* **7. Characteristic Vocabulary:** "Place," "community," "somewheres vs. anywheres," "social fabric," "dignity of labour," "foundational economy," "broken consensus," "regional inequality," "extractive."
* **8. Temporal Orientation:** Hermeneutic (meaning-making) and prescriptive. It asks "What did the Brexit vote *mean*?" and uses that interpretation to prescribe a different future path.
* **9. Temporal Formation:** Began to crystallise post-2016, gaining coherence as the limitations of the mainstream Leave and Remain positions became apparent. Evidence since formation is processed as **confirmation** of its initial thesis: that the fundamental problems have not been addressed.
* **Grammar Boundary:** If this grammar were forced to choose between a return to the pre-2016 EU model or the post-2021 free-trading model, its internal coalition would likely fracture. Its identity is defined by its opposition to both.

***

SECTION 4: SIGNAL PROCESSING

Grammar A: Liberal-Technocratic Institutionalism - The Inevitable Cost of Friction

Processing the signal set through this grammar yields a clear, consistent, and bleak narrative. The foundational rule is that economic outcomes are determined by material conditions, and the primary condition changed in 2021 was the imposition of friction on the UK's relationship with its largest and closest trading partner. The 52-48 referendum result is acknowledged as the political event that triggered the process, but it is treated as a policy input error, a moment where public sentiment, swayed by misinformation, overrode rational self-interest. The causal chain is direct and unforgiving.

The core signals of a GDP growth slowdown relative to peers and the drop in UK-EU trade volumes are the master variables. They are not ambiguous; they are the predictable result of leaving the Single Market and Customs Union, precisely as gravity models of trade would forecast. The OBR's assessment that the new trade relationship will reduce the UK's long-run productivity by 4% is accepted as a baseline reality. The fact that RoW trade has not compensated for the loss is seen as further confirmation, as deals with geographically distant partners like Australia (a marginal GDP impact of ~0.08%) can never replace frictionless trade with a 450-million-person market next door.

Counter-signals are processed as exceptions that prove the rule. The UK's successful vaccine rollout is framed not as a benefit of sovereignty, but as a result of the UK's MHRA being a highly competent regulator that *could* have acted similarly within EU structures via emergency provisions, even if the EU's collective mechanism was slower. It is a one-off event, contrasted with the permanent, structural drag of trade barriers. The resilience of the City of London is explained by its deep pools of capital and talent and its global, rather than purely European, focus. However, the grammar highlights the slow bleed of assets and listings to New York and EU centres as the more significant long-term trend, even if the "big bang" collapse did not occur.

The most damning signal for this grammar is the record-high net migration. It shows that Brexit failed even on the prospectus of its proponents, swapping a system of free movement with economically integrated neighbours for a more costly and less controlled system of long-distance migration to fill labour shortages exacerbated by the new trade barriers. The Northern Ireland Protocol/Windsor Framework is seen as a messy but necessary containment exercise—an admission that a hard Brexit is incompatible with peace in Northern Ireland, forcing the UK to accept EU single market rules for the region. It is the material reality of geography reasserting itself over political rhetoric.

The closure is architectural, built from these interlocking pieces. Brexit, as enacted, was an economic and institutional blunder. The UK is poorer, less productive, and more peripheral than it would have been. Its institutions are under strain, evidenced by the Scottish question and the NI arrangements. The only rational path forward is to systematically reduce the frictions with the EU, pursuing a Swiss-style relationship or even re-entry into the Single Market, regardless of the political difficulty. The cost of divergence is simply too high for any other conclusion to be admissible.

Grammar B: National-Democratic Sovereignty - Reclaiming Control and Awaiting the Dawn

Operating this grammar requires placing the 2016 referendum result at the absolute centre of the analysis. It is not a policy error but the "logos" of the entire period: a sovereign people's clear and permanent instruction to restore self-governance. The 52-48 margin is irrelevant; in a democracy, a win is a win. The primary task since has been to implement this instruction. All other signals are processed in relation to this goal.

Economic signals are systematically re-interpreted or de-prioritised. The GDP slowdown is attributed primarily to the global shocks of the COVID-19 pandemic and the energy crisis following Russia's invasion of Ukraine—events that would have occurred regardless of EU membership. Any UK-specific underperformance is framed as the fault of a globalist establishment (the Bank of England, the Treasury) that talked down the economy and was too timid in pursuing radical divergence. The drop in EU trade is an expected "re-orientation" of the economy, a temporary cost of freeing the UK to pursue more profitable "Global Britain" opportunities. The new trade deals with the CPTPP bloc are celebrated not for their immediate economic value, but as powerful symbols of this new freedom, creating beachheads in the fast-growing economies of the future.

The prime counter-signal for other grammars—the vaccine rollout—is the prime *confirmation* signal here. It is seen as irrefutable proof of the benefits of agility outside the EU's bureaucracy. It demonstrates what is possible when the UK is free to act in its own interests. Conversely, the counter-signal of record-high net migration is processed as a betrayal. The problem is not Brexit, but the politicians' failure to *use* the control over borders that Brexit delivered. It is evidence of an establishment that, while paying lip-service to the referendum, is still addicted to cheap labour and refuses to implement the will of the people. This transforms a failure of the project into a failure of its custodians, preserving the integrity of the core idea.

The Northern Ireland Protocol is the grammar's point of maximum stress. In its initial form, it was an intolerable betrayal, imposing a border *within* the United Kingdom and subjugating a part of it to foreign laws and courts. The Windsor Framework is seen as an improvement, a partial victory for tough

negotiation, but still a compromise that leaves the job unfinished. It is a battleground, not a settlement. Signals of regulatory divergence are weighted heavily, seen as the very purpose of the project. Every EU law not copied, every new UK-specific regulation, is a dividend. The fact that there hasn't been a "bonfire" is, again, blamed on a risk-averse civil service, not a flaw in the Brexit project itself.

The closure is one of principle and patience. The UK has successfully reclaimed its national and democratic sovereignty, a historic achievement that cannot be measured by GDP points in the short term. The project is incomplete, hampered by external shocks and internal enemies. The economic benefits ("Brexit opportunities") have been delayed, not denied. The solution is not to reverse course or align with the EU, but to press forward with more vigour: more divergence, tighter border controls, and a more robustly independent foreign policy. To do otherwise would be to betray the democratic mandate of 2016 and render the entire struggle meaningless.

Grammar C: Post-Liberal Communitarianism - A Revolution Betrayed

This emergent grammar processes the signal set not to vindicate or condemn Brexit, but to diagnose a deeper pathology within the British state and economy. The 2016 referendum is neither an error nor a sacred text; it is a symptom. It was a visceral, often inarticulate, revolt by the "somewheres"—people rooted in place and community—against the "anywheres"—a mobile, globalised elite for whom national borders are an inconvenience. The vote was a demand for a different kind of economy, one that prioritises community, stability, and dignity over abstract efficiency and capital mobility.

From this perspective, the post-2016 experience has been a profound failure, a "bait and switch." The signals of economic slowdown are acknowledged but re-framed. The issue isn't a 2% hit to aggregate GDP, a number that means little to a town that lost its industry 30 years ago. The crucial signals are the *persistence* of regional inequality, the struggles of foundational sectors like food production and social care, and the declining trust in all institutions. These indicate that the fundamental structure of the UK's extractive, London-centric political economy has not changed.

The record-high net migration signal is central and damning. For Grammar C, the objection to the EU's free movement was not primarily about ethnicity, but about its suppression of wages for low-skilled workers and the strain it placed on public services in specific communities without commensurate investment. The post-Brexit shift to even higher levels of non-EU migration, driven by the same business demand for cheap labour, is a total betrayal of the referendum's implicit promise. It proves that the "take back control" slogan was hollow; control was taken from Brussels only to be handed back to the same corporate interests and treasury officials who want mass migration to flatter GDP figures.

The trade signals are viewed with detachment. The obsession with frictionless trade (Grammar A) or new free trade deals (Grammar B) is seen as missing the point. A "good" Brexit would have involved re-shoring supply chains, protecting key industries, and using the new tariff autonomy to foster a more resilient and less globalised domestic economy. The CPTPP deal is seen as largely irrelevant or even harmful, exposing British farmers to competition while doing nothing for de-industrialised towns.

The resilience of the City of London is not a counter-signal; it is a core part of the problem. It demonstrates that the financialised, disembedded part of the economy remains dominant, its fortunes disconnected from the rest of the country. The Northern Ireland framework is seen as yet another elite pact, a technical fix that ignores the underlying community and identity tensions. The rise in support for Scottish independence is an entirely predictable consequence of a state that fails to provide a sense of shared purpose or economic security for all its constituent parts.

The closure of this grammar is one of disillusionment and a call for a more radical transformation. Brexit was a legitimate revolt, but it was captured and betrayed by a free-market elite who delivered "globalisation-on-steroids" instead of the secure, community-focused economy that people voted for. The

real political divide is not Leave vs. Remain, but between a liberal elite (both Leavers and Remainers) and the working communities of the nation. The only path forward is a fundamental break with the economic consensus of the last 40 years, a project for which the current form of Brexit has been a distraction, not a solution.

***

SECTION 5: CLOSURE COMPARISON

This section compares the outputs of the three grammars.

* **Ontological Check:** Are the grammars analysing the same phenomenon? Yes and no. All three are analysing the consequences of the UK's departure from the EU. However, they define the *essence* of that phenomenon differently. For Grammar A, it is an economic event. For Grammar B, it is a constitutional event. For Grammar C, it is a socio-political event. They are analysing the same trigger, but different facets of its impact, leading to an ontological divergence in what "Brexit" *is*.

* **Closure Content:**
  * **A:** Brexit is an economic failure requiring mitigation through closer EU alignment.
  * **B:** Brexit is a democratic success requiring more vigorous implementation.
  * **C:** Brexit is a betrayed revolution requiring a fundamental rethink of the national economic model.

* **Signal Divergence:** The grammars produce divergent outcomes by radically differing in their **weighting** and **causal attribution** of the same signals.
  * *GDP/Trade Data:* Weighted as paramount by A; re-attributed to external shocks by B; seen as a misleading distraction by C.
  * *Referendum Result:* A policy error for A; a sacred instruction for B; a symptom of social decay for C.
  * *Net Migration:* Proof of failure for A; proof of betrayal for B; proof of a betrayed revolution for C.

* **Exclusion Patterns:**
  * **A** excludes non-quantifiable values like sovereignty and identity.
  * **B** excludes or explains away negative economic data that contradicts its core principle.
  * **C** excludes aggregate economic data and the concerns of mobile, globalised capital (e.g., the City of London).

* **Causal Architecture:**
  * **A:** Linear and materialist (Barriers -> Costs -> Lower Growth).
  * **B:** Deontological and counter-factual (Sovereignty -> Enablement -> Future Growth). Failures are due to contingent, external blockages.
  * **C:** Dialectical (Thesis: Globalisation -> Antithesis: Referendum -> Flawed Synthesis: Brexit Deal -> Demand for New Synthesis).

* **Closure Timing:**
  * **A's** closure was formed pre-referendum and has only been confirmed.
  * **B's** closure was formed in the 1990s and has been in a state of damage-control and re-confirmation since 2016.
  * **C's** closure is post-2016, forming in response to the perceived failures of both A and B.

* **Grammar Translation:**
  * **A on B:** "Grammar B represents a post-truth politics that dangerously ignores economic reality, prioritising a fetishised notion of 'sovereignty' over the measurable welfare of citizens. Its closure is a recipe for continued national decline."

* **B on A:** "Grammar A is the voice of a defeated establishment and a globalist elite that refuses to accept a democratic result. Its 'evidence' is just the continuation of 'Project Fear,' designed to talk down Britain and force us back into the EU's orbit."
* **B on C:** "Grammar C correctly identifies the desire for change but wrongly blames Brexit. It is a pessimistic, declinist grammar that lacks faith in Britain's ability to succeed on the world stage."
* **C on A & B:** "Grammars A and B are two wings of the same exhausted liberal consensus. A represents the 'anywheres' who ran the pre-Brexit system for their own benefit, while B represents the 'anywheres' who hijacked the revolt of the 'somewheres' to install a different version of the same extractive model. Both their closures fail to address the core problem of a broken social contract."

***

SECTION 6: COUNTER-SIGNALS, LEAKAGE, AND STRESS TEST

* **Consolidated Counter-signals:**
* **For A (Liberal-Technocratic):** The resilience of the City of London and the speed of the vaccine rollout. These signals show that sovereignty *can* have upsides and that the UK possesses non-EU-dependent strengths, complicating a purely negative economic narrative.
* **For B (National-Sovereignty):** Record-high net migration post-Brexit. This signal frontally assaults the core "take back control" promise and cannot be easily blamed on external factors. It suggests a fundamental contradiction within the pro-Brexit coalition between social conservatives and free-market libertarians.
* **For C (Post-Liberal):** The simple fact that a significant portion of the population, particularly in affluent areas, reports being content with the outcome and does not share the sense of "betrayal." This challenges the universality of its "broken contract" diagnosis.

* **Leakage:** "Leakage" occurs when one grammar is forced to adopt the terms of another. A prime example is Grammar B's need to constantly talk about economic growth and "opportunities." While its primary variable is sovereignty, it must justify it in the economic language of Grammar A to remain politically viable, suggesting the hegemonic power of economic justification in modern political discourse. Similarly, Grammar A has been forced to develop responses on identity and democracy, even if just to dismiss them, showing it cannot completely ignore the terrain of Grammar B.

* **Grammar Stress Test:**
* **Most Threatening Counter-Signal for A:** A sustained period (e.g., 5+ years) where a divergent UK *significantly* outgrows the EU bloc. This would directly falsify its core causal chain.
* **Most Threatening Counter-Signal for B:** The definitive breakup of the United Kingdom, with Scotland re-joining the EU. This would show that the pursuit of English-coded sovereignty destroyed the larger state, a catastrophic failure of the project's own statecraft.
* **Most Threatening Counter-Signal for C:** The emergence of a genuinely popular political movement that successfully fuses the patriotism and optimism of Grammar B with the economic security concerns of Grammar C, rendering its "betrayal" narrative obsolete.

***

SECTION 7: POST-ANALYSIS REFLEXIVE NOTE

* **Comparison against Step 0:** The analysis confirms the initial declaration. My "home grammar" (A) is indeed the easiest to articulate. Its logic feels natural and data-driven. The hardest grammar was B, as predicted. Faithfully operating its logic required suspending my default mode of economic consequentialism and instead treating "sovereignty" as the primary, intrinsic good, processing all other information through that lens. It was a constant effort to avoid re-describing its logic as simply "ignoring facts." Grammar C was

intellectually stimulating, offering a powerful critique of the other two, and its emergent nature made it an interesting subject of construction.

* **Discovered Blind Spots:** The exercise revealed a key blind spot in my home grammar: its difficulty in processing the *emotional and identity-based power* of the sovereignty argument. Grammar A tends to see supporters of Grammar B as having been "duped." This analysis forces the recognition that Grammar B is a complete and internally coherent worldview, not just a set of cognitive errors. It also revealed how all three grammars struggle with the paradoxical signal of high migration, showing none has a complete monopoly on truth.

* **How Analysis Would Differ:** If my home grammar had been B, the entire tone and focus would have shifted. The analysis would have been framed as a story of liberation. The Signal Processing section for Grammar B would be the baseline narrative, while Grammar A would be portrayed as a pessimistic, almost unpatriotic force of opposition. The core tension would not be "economic damage vs. sovereignty" but "democracy vs. a recalcitrant elite."

* **What the Exercise Reveals:** This prismatic analysis reveals that the intractable nature of the Brexit debate stems from the fact that the major interpretive communities are not just disagreeing on policy; they are operating with fundamentally different rule-systems for determining what is real, what is important, and what constitutes a valid explanation. They are, as Jazinski's title suggests, processing the same world into different truths.

***

SECTION 8: METHODOLOGICAL OBSERVATIONS

* **What Worked:** The Prismatic Method is exceptionally effective at de-naturalising one's own viewpoint. The strict requirement to specify the parameters of each grammar (especially signal selection, weighting, and excluded signals) forces the analyst to see each perspective as a structured system rather than a collection of opinions. The "Grammar Translation" step is a particularly powerful tool for revealing the core antagonisms. The concept of an "emergent" grammar (Grammar C) was also vital for capturing a significant part of the discourse that is not reducible to the two main camps.

* **Difficulties:** The greatest difficulty lies in maintaining "interpretive fidelity" and avoiding caricature, especially for the grammar most distant from one's own. It requires a conscious act of intellectual empathy. Quantifying the "weighting priority" is also more of an art than a science. Furthermore, in a real-world scenario, these grammars are not perfectly sealed; individuals often hold contradictory elements from multiple grammars simultaneously. The method necessarily simplifies this messy reality to achieve analytical clarity.

* **Suggestions for Refinement:**
  1. **A "Hybridity" Parameter:** A parameter could be added to describe how porous each grammar is to others—its "leakiness."
  2. **Mapping Grammars to Demographics:** While not part of this analysis, a powerful extension would be to map the prevalence of each grammar onto demographic, geographic, and educational data to see how these worldviews are socially distributed.
  3. **Intensity Scale:** A way to measure the "emotional valence" or "affective intensity" of certain signals within each grammar could add another layer of texture, moving beyond purely cognitive processing.
